# Semantic Interpretation

- Back to meaning!
  - A very basic approach to computational semantics
  - Truth-theoretic notion of semantics (Tarskian)
  - .
  - Assign a "meaning" to each word Word meanings combine according to the parse structure
  - People can and do spend entire courses on this topic
  - We'll spend about an hour!

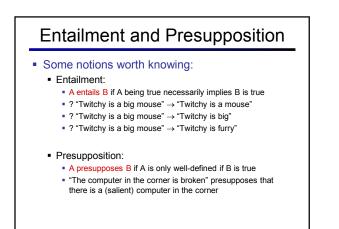

### • What's NLP and what isn't?

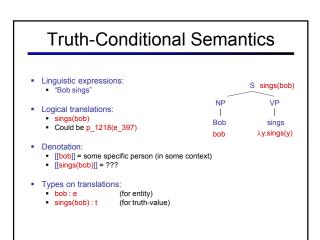

- Designing meaning representations?
- Computing those representations?
- Reasoning with them?
- Supplemental reading will be on the web page.

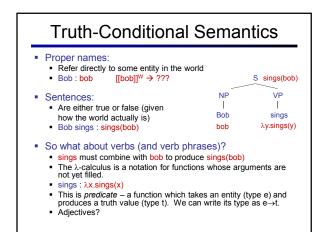

# Meaning "Meaning" • What is meaning? • "The computer in the corner." • "Bob likes A lice." • "I think I am a gummi bear." • Knowing whether a statement Knowing whether a statement is true? Knowing the conditions under which it's true? Being able to react appropriately to it? "Who does Bob like?" "Close the door." A distinction: Linguistic (semantic) meaning "The door is open

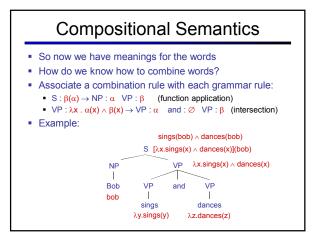

Speaker (pragmatic) meaning

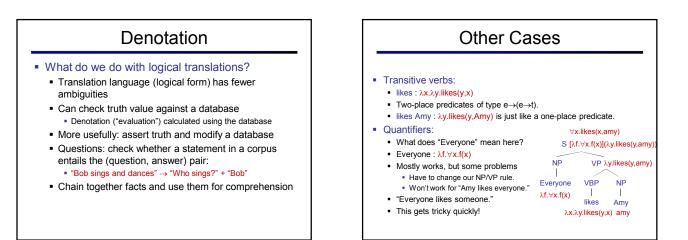

Today: assembling the semantic meaning of sentence from its parts

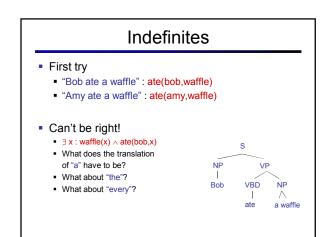

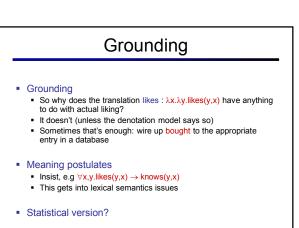

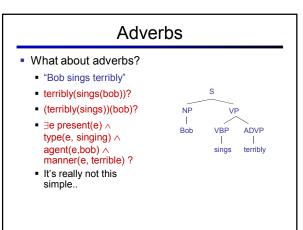

# Tense and Events

- In general, you don't get far with verbs as predicates
- Better to have event variables e
  - "Alice danced" : danced(alice)
  - ∃ e : dance(e) ∧ agent(e,alice) ∧ (time(e) < now)
- Event variables let you talk about non-trivial tense / aspect structures
  - "Alice had been dancing when Bob sneezed"
  - ∃ e, e': dance(e) ∧ agent(e,alice) ∧
    - sneeze(e') < agent(e',bob) </br>  $(start(e) < start(e') \land end(e) = end(e')) \land$ (time(e') < now)

## **Propositional Attitudes**

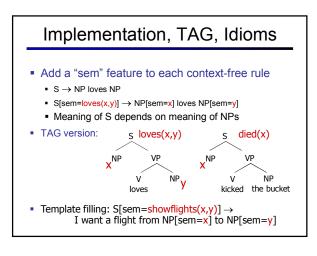

- "Bob thinks that I am a gummi bear"
- thinks(bob, gummi(me)) ?
- thinks(bob, "I am a gummi bear")?
- thinks(bob, ^gummi(me)) ?
- Usual solution involves intensions (<sup>^</sup>X) which are, roughly, the set of possible worlds (or conditions) in which X is true
- Hard to deal with computationally
  - Modeling other agents models, etc
  - Can come up in simple dialog scenarios, e.g., if you want to talk about what your bill claims you bought vs. what you actually bought

# **Trickier Stuff**

- Non-Intersective Adjectives
- green ball :  $\lambda x$  [green(x)  $\wedge$  ball(x)] fake diamond :  $\lambda x$ .[fake(x)  $\wedge$  diamond(x)] ?  $\longrightarrow \lambda x$ .[fake(diamond(x))
- Generalized Quantifiers
- the : λf.[unique-member(f)]
- all : λf. λg [∀x.f(x) → g(x)]
   most?
- Could do with more general second order predicates, too (why worse?)
   the(cat, meows), all(cat, meows)
- Generics
- "Cats like naps"
- Cats like haps
   "The players scored a goal"
  Pronouns (and bound anaphora)
- "If you ha ve a dime, put it in t
- ... the list goes on and on!

# **Multiple Quantifiers**

- Quantifier scope
  - Groucho Marx celebrates quantifier order ambiguity: "In this country a woman gives birth every 15 min. Our job is to find that woman and stop her."
- Deciding between readings
  - "Bob bought a pumpkin every Halloween"
  - "Bob put a warning in every window"
  - Multiple ways to work this out
    - Make it syntactic (movement)
    - Make it lexical (type-shifting)

# Modeling Uncertainty

#### Gaping hole warning! • .

- Big difference between statistical disambiguation and statistical reasoning.
  - The scout saw the enemy soldiers with night goggles.
- With probabilistic parsers, can say things like "72% belief that the PP attaches to the NP."
   That means that *probably* the enemy has night vision goggles.
   However, you can't throw a logical assertion into a theorem prover with 72% confidence.

- Not clear humans really extract and process logical statements symbolically anyway.
  Use this to decide the expected utility of calling reinforcements?
- In short, we need probabilistic reasoning, not just probabilistic disambiguation followed by symbolic reasoning! •

CCG Parsing Combinatory Categorial  $\mathit{John} \vdash \mathsf{NP}$  :  $\mathit{john'}$ Grammar Fully (mono-) lexicalized grammar
 Categories encode argument sequences
 Very closely  $\mathit{shares} \vdash \mathsf{NP} : \mathit{shares'}$  $buys \vdash (S \setminus NP) / NP : \lambda x. \lambda y. buys' xy$  $sleeps \vdash S \setminus NP : \lambda x.sleeps'x$  $well \vdash (S \setminus NP) \setminus (S \setminus NP) : \lambda f. \lambda x. well'(fx)$  Very closely related to the lambda calculus NP S\NP Can have spurious ambiguities (why?) John (S\NP)/NP NP buys shares
