Bridging the Gap between Web Browser and IDE

Björn Hartmann
Mark Dhillon, Matthew Chan

| Like Two Ships in the Night...

Developers spend significant time outside their code editor and inside their Web browser.

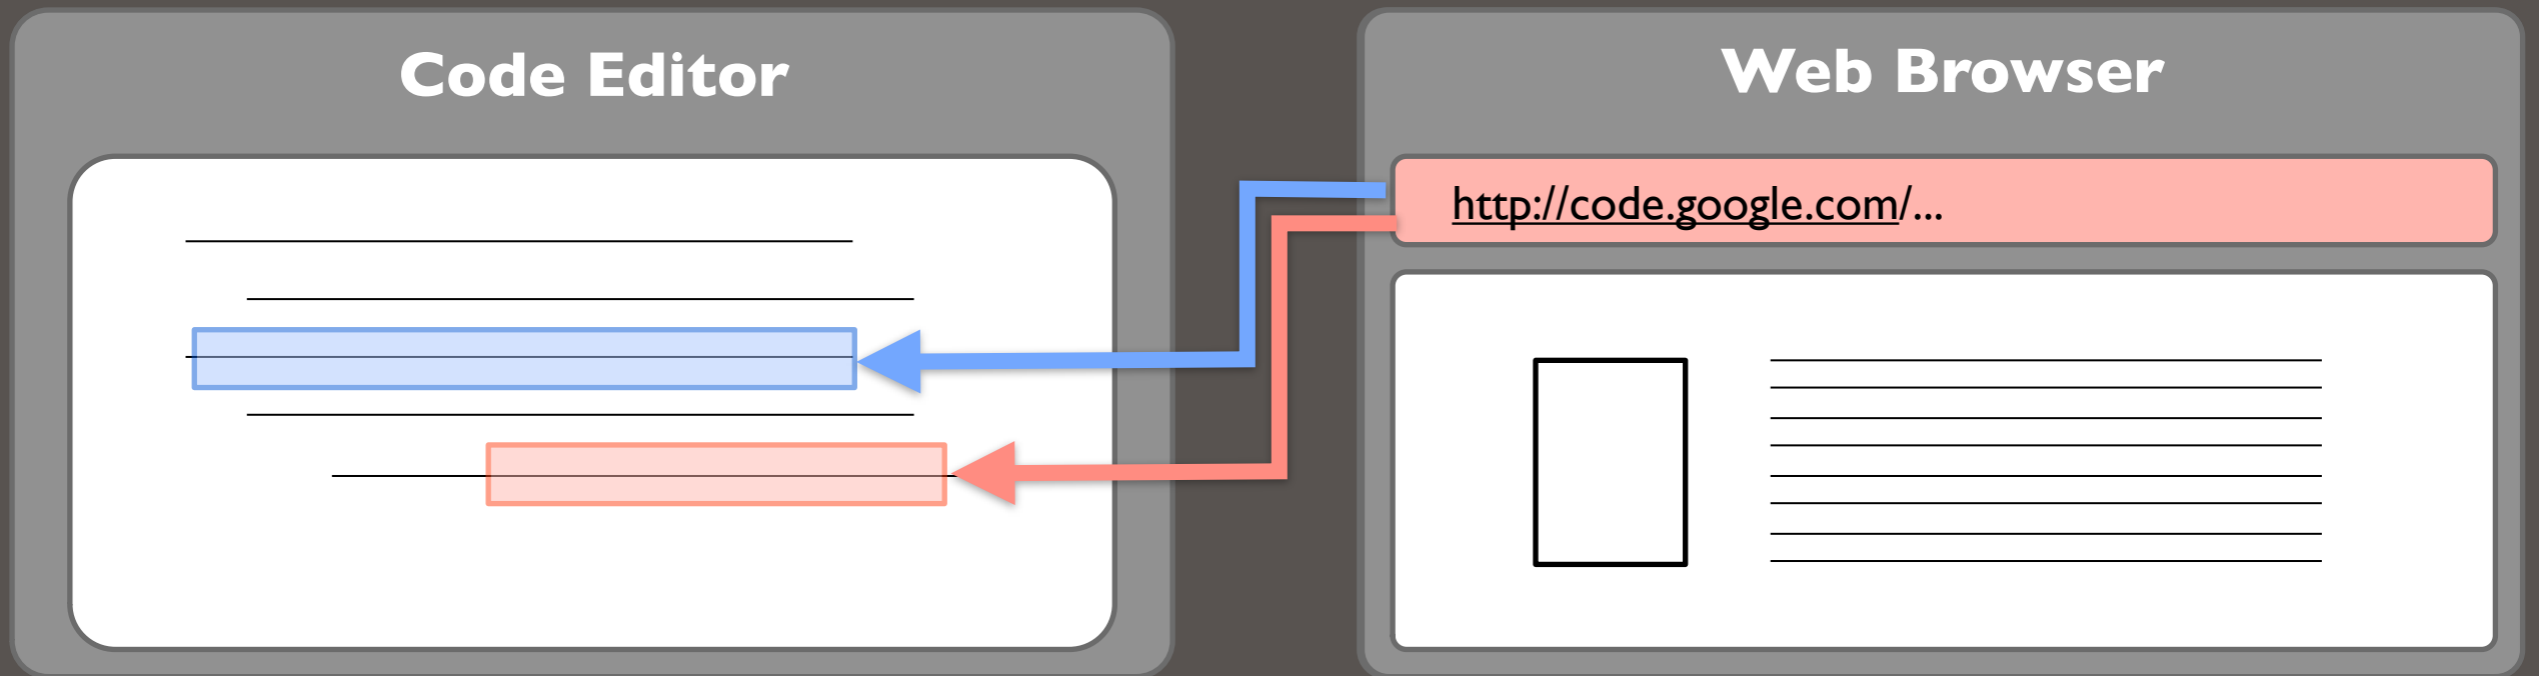

*19% of programming time is spent on the web
(Brandt, CHI'10)*

Editors and browsers remain largely unaware of each other.

| Bridging the Gap

Research idea: Track web history directly inside source documents.

Hypothesis: Saving web pages visited while editing code can (1) help developers re-retrieve relevant pages and (2) facilitate code understanding.

Properties of Fourier Transform

The properties of the Fourier transform are summarized below. The properties of the Fourier transform of periodic functions discussed above are special cases of these listed below in the following, as usual: $\mathcal{F}\{x(t)\} = X(\omega)$ and $\mathcal{F}\{y(t)\} = Y(\omega)$.

- Linearity
- Time shift
- Frequency shift
- Time reversal
- Frequency reversal

2. Final page before editing
3. Explicit mark

| User Experiences

| How much code gets annotated?

2 hours programming competition with HyperSource (n=4):

	mean	min	max
Web Pages visited	37	26	49
Code lines annotated	7/141	5/102	9/177

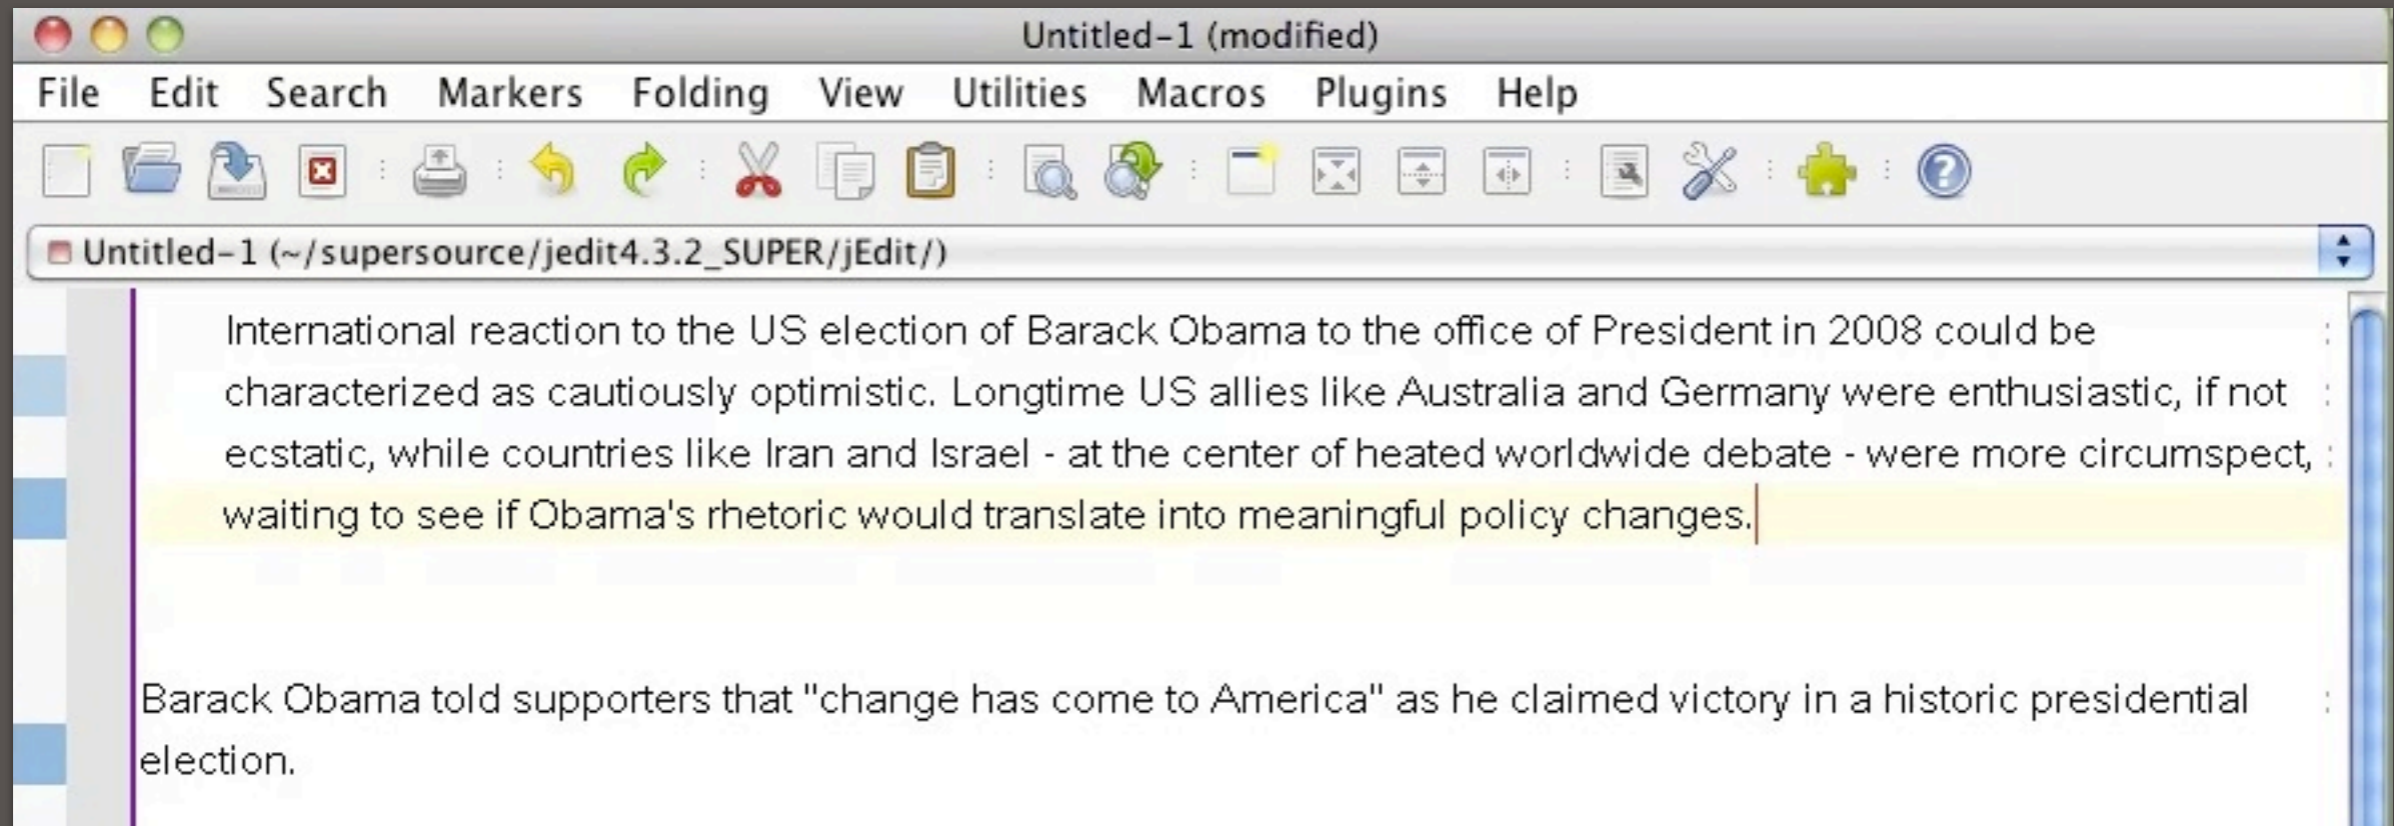

| How useful are annotations?

Review source files with and without annotations, then answer a series of questions about code (n=4).

Survey feedback:

- Helped understand unfamiliar code:
“It was much easier to answer the questions with the annotated URLs”
- Web pages were used as starting points

Can this approach apply to other authoring tasks?

| HyperSource

Collects visited web pages and associate them with lines of code that developers subsequently write.

Tracks and shows associations within each source file.
