

# CS-184: Computer Graphics

## Lecture #19: Motion Capture

Prof. James O'Brien  
University of California, Berkeley

©2014-09-10

### Today

- Motion Capture

# Motion Capture

- Record motion from physical objects
- Use motion to animate virtual objects

Simplified Pipeline:

# Basic Pipeline

From Rose, et al., 1998

## What types of objects?

- Human, whole body
- Portions of body
- Facial animation
- Animals
- Puppets
- Other objects

5

## Capture Equipment

- Passive Optical
  - Reflective markers
  - IR (typically) illumination
  - Special cameras
    - Fast, high res., filters
  - Triangulate for positions

Images from Motion Analysis

6

## Capture Equipment

- Passive Optical Advantages

- Accurate
- May use many markers
- No cables
- High frequency

- Disadvantages

- Requires lots of processing
- Expensive systems
- Occlusions
- Marker swap
- Lighting / camera limitations

7

## Capture Equipment

- Active Optical

- Similar to passive but uses LEDs
- Blink IDs, no marker swap
- Number of markers trades off w/ frame rate

Phoenix Technology

Phase Space

---

## Performance Capture

- Many studios regard *Motion* Capture as evil
  - Synonymous with low quality motion
  - No directive / creative control
  - Cheap
- **Performance Capture is different**
  - Use mocap device as an expressive input device
  - Similar to digital music and MIDI keyboards

13

## Manipulating Motion Data

- Basic tasks
  - Adjusting
  - Blending
  - Transitioning
  - Retargeting
- Building graphs

14

# Adjusting

- Define desired motion function in parts

# Adjusting

- Select adjustment function from “some nice space”
  - Example C2 B-splines
- Spread modification over reasonable period of time
  - User selects support radius

# Adjusting

IK uses control points of the B-spline now

Example:  
position racket  
fix right foot  
fix left toes  
balance

Witkin and Popovic SIGGRAPH 95

# Adjusting

Witkin and Popovic SIGGRAPH 95

What if adjustment periods overlap?

20

---

---

---

---

---

---

---

---

---

---

# Blending

- Given two motions make a motion that combines qualities of both

$$m_{\alpha}(t) = \alpha m_a(t) + (1 - \alpha)m_b(t)$$

- Assume same DOFs
- Assume same parameter mappings

---

---

---

---

---

---

---

---

---

---

# Blending

- Consider blending *slow-walk* and *fast-walk*

---

---

---

---

---

---

---

---

---

---

## Blending

- Define timewarp functions to align features in motion

Normalized time is  $w$

23

## Blending

- Blend in normalized time

$$\mathbf{m}_\alpha(w) = \alpha \mathbf{m}_a(w_a) + (1 - \alpha) \mathbf{m}_b(w_b)$$

- Blend playback rate

$$\frac{dt}{dw} = \alpha \frac{dt}{dw_a} + (1 - \alpha) \frac{dt}{dw_b}$$

24

# Blending

- Blending may still break features in original motions

25

---

---

---

---

---

---

---

---

---

---

# Blending

- Add explicit constrains to key points
  - Enforce with IK over time

26

---

---

---

---

---

---

---

---

---

---

## Blending / Adjustment

- Short edits will tend to look acceptable
- Longer ones will often exhibit problems
- Optimize to improve blends / adjustments
  - Add quality metric on adjustment
  - Minimize accelerations / torques
  - Explicit smoothness constraints
  - Other criteria...

27

## Multivariate Blending

- Extend blending to multivariate interpolation

$m(w) = \sum_i \alpha_i(w) m_i(w)$

$\sum_i \alpha_i(w) = 1$

28

# Multivariate Blending

- Extend blending to multivariate interpolation

Use standard scattered-data interpolation methods

# Transitions

- Transition from one motion to another

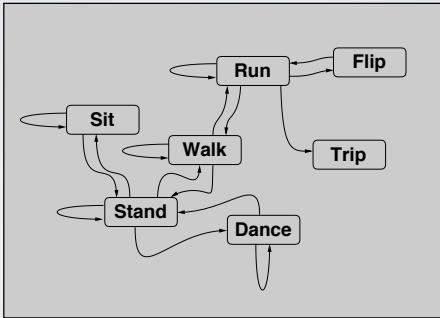

# Cyclification

- Special case of transitioning
- Both motions are the same
- Need to modify beginning and end of a motion simultaneously

# Transition Graphs

# Motion Graphs

- Hand build motion graphs often used in games
  - Significant amount of work required
  - Limited transitions by design
- Motion graphs can also be built automatically

33

# Motion Graphs

- Similarity metric
  - Measurement of how similar two frames of motion are
    - Based on joint angles or point positions
    - Must include some measure of velocity
    - Ideally independent of capture setup and skeleton
- Capture a "large" database of motions

34

## Motion Graphs

- Random walks
  - Start in some part of the graph and randomly make transitions
  - Avoid dead ends
  - Useful for "idling" behaviors
- Transitions
  - Use blending algorithm

35

## Motion graphs

- Match imposed requirements
  - Start at a particular location
  - End at a particular location
  - Pass through particular pose
  - Can be solved using *dynamic programming*
  - Efficiency issues may require approximate solution
  - Notion of "goodness" of a solution

36

# Typical Motion Graph
