Natural Language Processing

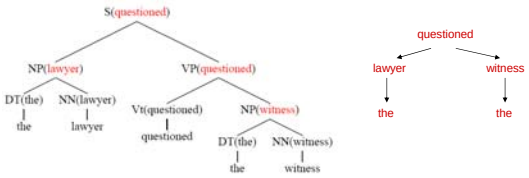
Parsing IV

Dan Klein – UC Berkeley

Other Syntactic Models

Dependency Parsing

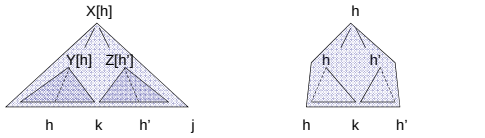
- Lexicalized parsers can be seen as producing *dependency trees*



- Each local binary tree corresponds to an attachment in the dependency graph

Dependency Parsing

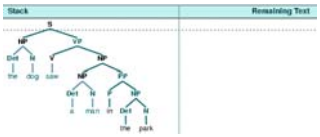
- Pure dependency parsing is only cubic [Eisner 99]



- Some work on *non-projective* dependencies
  - Common in, e.g. Czech parsing
  - Can do with MST algorithms [McDonald and Pereira 05]

Shift-Reduce Parsers

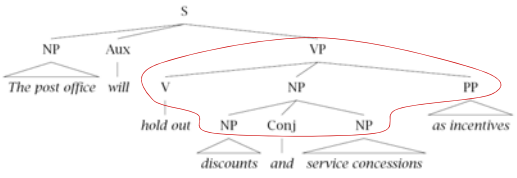
- Another way to derive a tree:



- Parsing
  - No useful dynamic programming search
  - Can still use beam search [Ratnaparkhi 97]

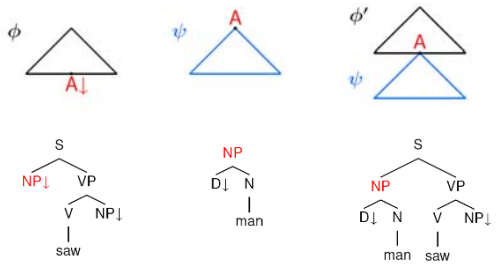
Tree Insertion Grammars

- Rewrite large (possibly lexicalized) subtrees in a single step



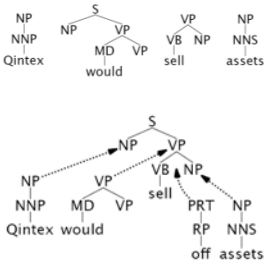
- Formally, a *tree-insertion grammar*
- Derivational ambiguity whether subtrees were generated atomically or compositionally
- Most probable *parse* is NP-complete

TIG: Insertion

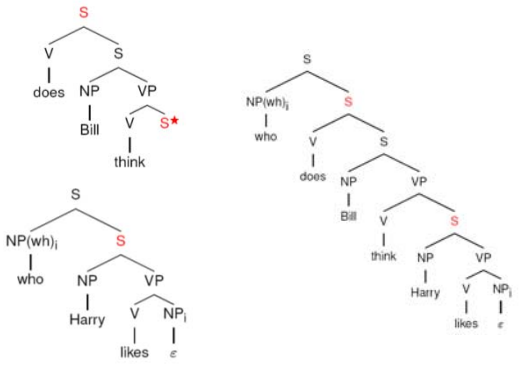


Tree-adjoining grammars

- Start with *local trees*
- Can insert structure with *adjunction* operators
- Mildly context-sensitive
- Models long-distance dependencies naturally
- … as well as other weird stuff that CFGs don't capture well (e.g. cross-serial dependencies)



TAG: Long Distance



CCG Parsing

- Combinatory Categorial Grammar
  - Fully (mono-) lexicalized grammar
  - Categories encode argument sequences
  - Very closely related to the lambda calculus (more later)
  - Can have spurious ambiguities (why?)

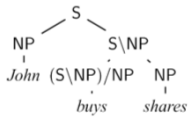
$John \vdash \mathrm{NP}$

$shares \vdash \mathrm{NP}$

$buys \vdash (\mathrm{S}\backslash\mathrm{NP})/\mathrm{NP}$

$sleeps \vdash \mathrm{S}\backslash\mathrm{NP}$

$well \vdash (\mathrm{S}\backslash\mathrm{NP})\backslash(\mathrm{S}\backslash\mathrm{NP})$

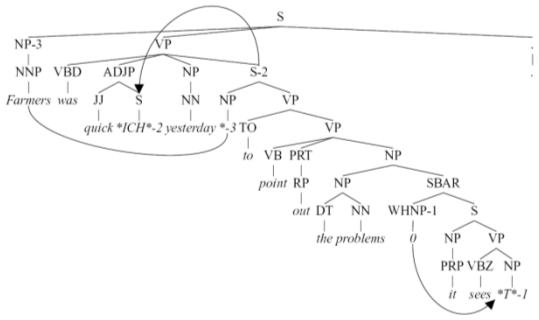


Empty Elements

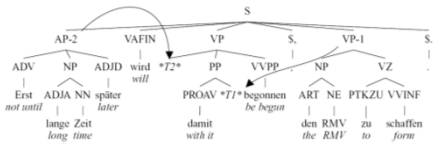
Empty Elements

- In the PTB, three kinds of empty elements:
  - Null items (usually complementizers)
  - Dislocation (WH-traces, topicalization, relative clause and heavy NP extraposition)
  - Control (raising, passives, control, shared argumentation)
- Need to reconstruct these (and resolve any indexation)

Example: English

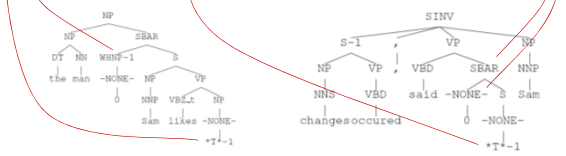


Example: German



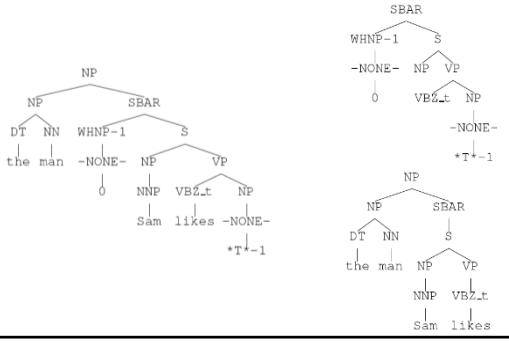
Types of Empties

Antecedent	POS	Label	Count	Description
NP	NP	*	18,334	NP trace (e.g., *Sam was seen **)
	NP	*	9,812	NP PRO (e.g., * to sleep is nice)
WHNP	NP	*T*	8,620	WH trace (e.g., *the woman who you saw *T**)
		U	7,478	Empty units (e.g., *$ 25 *U**)
		0	5,635	Empty complementizers (e.g., *Sam said 0 Sasha snores*)
S	S	*T*	4,063	Moved clauses (e.g., *Sam had to go, Sasha explained *T**)
WHADVP	ADVP	*T*	2,492	WH-trace (e.g., *Sam explained how to leave *T**)
	SBAR		2,033	Empty clauses (e.g., *Sam had to go, Sasha explained (SBAR)*)
	WHNP	0	1,759	Empty relative pronouns (e.g., *the woman 0 we saw*)
	WHADVP	0	575	Empty relative pronouns (e.g., *no reason 0 to leave*)



A Pattern-Matching Approach

- [Johnson 02]



Pattern-Matching Details

- Something like transformation-based learning
- Extract patterns
  - Details: transitive verb marking, auxiliaries
  - Details: legal subtrees
- Rank patterns
  - Pruning ranking: by correct / match rate
  - Application priority: by depth
- Pre-order traversal
- Greedy match

Top Patterns Extracted

Count	Match	Pattern
5816	6223	(S (NP (-NONE- *)) VP)
5605	7895	(SBAR (-NONE- 0) S)
5312	5338	(SBAR WHNP-1 (S (NP (-NONE- *T*-1)) VP))
4434	5217	(NP QP (-NONE- *U*))
1682	1682	(NP $ CD (-NONE- *U*))
1327	1593	(VP VBN_t (NP (-NONE- *)) PP)
700	700	(ADJP QP (-NONE- *U*))
662	1219	(SBAR (WHNP-1 (-NONE- 0)) (S (NP (-NONE- *T*-1)) VP))
618	635	(S S-1 , NP (VP VBD (SBAR (-NONE- 0) (S (-NONE- *T*-1)))) .)
499	512	(SINV `` S-1 , '' (VP VBZ (S (-NONE- *T*-1))) NP .)
361	369	(SINV `` S-1 , '' (VP VBD (S (-NONE- *T*-1))) NP .)
352	320	(S NP-1 (VP VBZ (S (NP (-NONE- *-1)) VP)))
346	273	(S NP-1 (VP AUX (VP VBN_t (NP (-NONE- *-1)) PP)))
322	467	(VP VBD_t (NP (-NONE- *)) PP)
269	275	(S `` S-1 , '' NP (VP VBD (S (-NONE- *T*-1))) .)

Results

Empty node POS	Empty node Label	Section 23 P	Section 23 R	Section 23 f	Parser output P	Parser output R	Parser output f
(Overall)		0.93	0.83	0.88	0.85	0.74	0.79
NP	*	0.95	0.87	0.91	0.86	0.79	0.82
NP	*T*	0.93	0.88	0.91	0.85	0.77	0.81
	0	0.94	0.99	0.96	0.86	0.89	0.88
	U	0.92	0.98	0.95	0.87	0.96	0.92
S	*T*	0.98	0.83	0.90	0.97	0.81	0.88
ADVP	*T*	0.91	0.52	0.66	0.84	0.42	0.56
SBAR		0.90	0.63	0.74	0.88	0.58	0.70
WHNP	0	0.75	0.79	0.77	0.48	0.46	0.47

Semantic Roles

Semantic Role Labeling (SRL)

- Characterize clauses as *relations* with *roles*:

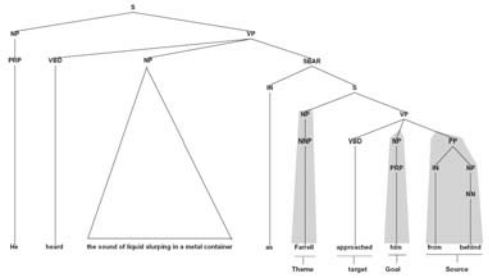
  [$_{Judge}$ She] **blames** [$_{Evaluee}$ the Government] [$_{Reason}$ for failing to do enough to help] .

  Holman would characterise this as **blaming** [$_{Evaluee}$ the poor] .

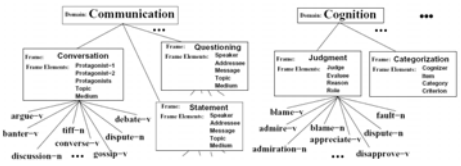
  The letter quotes Black as saying that [$_{Judge}$ white and Navajo ranchers] misrepresent their livestock losses and **blame** [$_{Reason}$ everything] [$_{Evaluee}$ on coyotes] .

- Says more than which NP is the subject (but not much more):
- Relations like *subject* are syntactic, relations like *agent* or *message* are semantic
- Typical pipeline:
  - Parse, then label roles
  - Almost all errors locked in by parser
  - Really, SRL is quite a lot easier than parsing

SRL Example



PropBank / FrameNet



- FrameNet: roles shared between verbs
- PropBank: each verb has its own roles
- PropBank more used, because it's layered over the treebank (and so has greater coverage, plus parses)
- Note: some linguistic theories postulate fewer roles than FrameNet (e.g. 5-20 total: agent, patient, instrument, etc.)

PropBank Example

fall.01 sense: move downward

roles:
- Arg1: thing falling
- Arg2: extent, distance fallen
- Arg3: start point
- Arg4: end point

Sales fell to $251.2 million from $278.7 million.

arg1: Sales
rel: fell
arg4: to $251.2 million
arg3: from $278.7 million

PropBank Example

rotate.02 sense: shift from one thing to another
roles: Arg0: causer of shift
Arg1: thing being changed
Arg2: old thing
Arg3: new thing

Many of Wednesday's winners were losers yesterday as investors quickly took profits and rotated their buying to other issues, traders said. (wsj_1723)
arg0: investors
rel: rotated
arg1: their buying
arg3: to other issues

PropBank Example

aim.01 sense: intend, plan
roles: Arg0: aimer, planner
Arg1: plan, intent

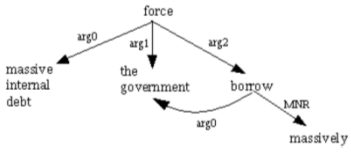
The Central Council of Church Bell Ringers aims *trace* to improve relations with vicars. (wsj_0089)
arg0: The Central Council of Church Bell Ringers
rel: aims
arg1: *trace* to improve relations with vicars

aim.02 sense: point (weapon) at
roles: Arg0: aimer
Arg1: weapon, etc.
Arg2: target

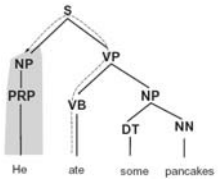
Banks have been aiming packages at the elderly.
arg0: Banks
rel: aiming
arg1: packages
arg2: at the elderly

Shared Arguments

```
(NP-SBJ (JJ massive) (JJ internal) (NN debt) )
  (VP (VBZ has)
    (VP (VBN forced)
      (S
        (NP-SBJ-1 (DT the) (NN government) )
        (VP
          (VP (TO to)
            (VP (VB borrow)
              (ADVP-MNR (RB massively) )...
```



Path Features



Path	*Description*
VB↑VP↓PP	PP argument/adjunct
VB↑VP↑S↓NP	subject
VB↑VP↓NP	object
VB↑VP↑VP↑S↓NP	subject (embedded VP)
VB↑VP↓ADVP	adverbial adjunct
NN↑NP↑NP↓PP	prepositional complement of noun

Results

- Features:
  - Path from target to filler
  - Filler's syntactic type, headword, case
  - Target's identity
  - Sentence voice, etc.
  - Lots of other second-order features
- Gold vs parsed source trees
  - SRL is fairly easy on gold trees
  - Harder on automatic parses

CORE		ARGM
