Machine Translation: Examples

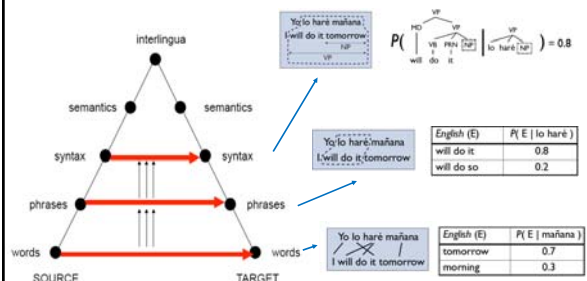

Atlanta, preso il killer del palazzo di Giustizia

ATLANTA - La grande paura che per 26 ore ha attanagliato Atlanta è finita: Brian Nichols, l'uomo che aveva ucciso tre persone a palazzo di Giustizia e che ha poi ucciso un agente di dogana, s'è consegnato alla polizia, dopo avere cercato rifugio nell'alloggio di una donna in un complesso d'appartamenti alla periferia della città. Per tutto il giorno, il centro della città, sede della Coca-Cola e dei Giochi 1996, cuore di una popolosa area metropolitana, era rimasto paralizzato.

Atlanta, taken the killer of the palace of Justice

ATLANTA - The great fear that for 26 hours has gripped Atlanta is ended: Brian Nichols, the man who had killed three persons to palace of Justice and that a customs agent has then killed, s' is delivered to the police, after to have tried shelter in the lodging of one woman in a complex of apartments to the periphery of the city. For all the day, the center of the city, center of the Coke Strains and of Giochi 1996, heart of one popolosa metropolitan area, was remained paralyzed.

Levels of Transfer

Word-Level MT: Examples

la politique de la haine .
politics of hate .
the policy of the hatred .

Phrasal MT: Examples

Le président américain Barack Obama doit annoncer lundi de nouvelles mesures en faveur des constructeurs automobile. General motors et Chrysler avaient déjà bénéficié fin 2008 d'un prêt d'urgence cumulé de 17,4 milliards de dollars, et ont soumis en février au Trésor un plan de restructuration basé sur un total de 22 milliards de dollars d'aides publiques supplémentaires.

Interrogé sur la chaîne CBS dimanche, le président a toutefois clairement précisé que le gouvernement ne prêterait pas d'argent sans de fortes contreparties. "Il faudra faire des sacrifices à tous les niveaux", a-t-il prévenu. "Tout le monde devra se réunir autour de la table et se mettre d'accord sur une restructuration en profondeur".

General Motors et Chrysler sont engagés dans des négociations avec le principal syndicat de l'automobile. Les constructeurs souhaitent diminuer leurs cotisations aux caisses de retraites, et accorder en échange des actions aux syndicats. Ils souhaiteraient également négocier des baisses des salaires.

U.S. President Barack Obama to announce Monday new measures to help automakers. General Motors and Chrysler had already received late in 2008 a cumulative emergency loan of 17.4 billion dollars, and submitted to the Treasury in February in a restructuring plan based on a total of 22 billion dollars in additional aid.

Interviewed on CBS Sunday, the president has clearly stated that the government does not lend money without strong counterparts. "We must make sacrifices at all levels," he warned. "Everyone should gather around the table and agree on a profound restructuring."

General Motors and Chrysler are engaged in negotiations with the major union of the car. Manufacturers wishing to reduce their contributions to pension funds, and give in exchange for the shares to trade unions. They would also negotiate lower wages.

Metrics

MT: Evaluation

- Human evaluations: subject measures, fluency/adequacy
- Automatic measures: n-gram match to references
 - NIST measure: n-gram recall (worked poorly)
 - BLEU: n-gram precision (no one really likes it, but everyone uses it)
 - Lots more: TER, HTER, METEOR, ...
- BLEU:
 - P1 = unigram precision
 - P2, P3, P4 = bi-, tri-, 4-gram precision
 - Weighted geometric mean of P1-4
 - Brevity penalty (why?)
 - Somewhat hard to game...
 - Magnitude only meaningful on same language, corpus, number of references, probably only within system types...

Reference (human) translation:
 The U.S. island of Guam is maintaining a high state of alert after the Guam airport and its offices both received an e-mail from someone calling himself the Saudi Arabian Osama bin Laden and threatening a biological chemical attack against public places such as the airport.

Machine translation:
 The American (?) international airport of the office receives one calls call the sand Arab ric business (?) and so on electronic mail, which sends out. The three will be able after public place and so on the airport to start the biochemistry attack. (?) highly alerts after the maintenance.

Automatic Metrics Work (?)

Phrase-Based System Overview

Many slides and examples from Philipp Koehn or John DeNero

Word Alignment

Word Alignment

- 1 Align words with a probabilistic model
- 2 Infer presence of larger structures from this alignment
- 3 Translate with the larger structures

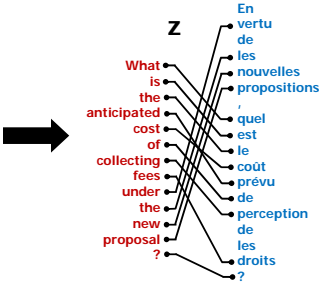

Word Alignment

X

What is the anticipated cost of collecting fees under the new proposal?

En vertu des nouvelles propositions, quel est le coût prévu de perception des droits?

Z

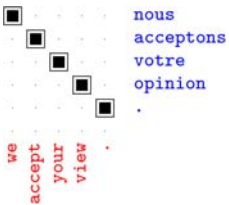

Unsupervised Word Alignment

- Input: a *bitext*: pairs of translated sentences

nous acceptons votre opinion .
we accept your view .

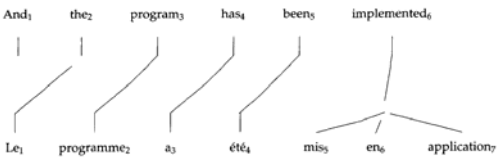

- Output: *alignments*: pairs of translated words
- When words have unique sources, can represent as a (forward) alignment function a from French to English positions

1-to-Many Alignments

And₁ the₂ program₃ has₄ been₅ implemented₆

Le₁ programme₂ a₃ été₄ mis₅ en₆ application₇

Evaluating Models

- How do we measure quality of a word-to-word model?
 - Method 1: use in an end-to-end translation system
 - Hard to measure translation quality
 - Option: human judges
 - Option: reference translations (NIST, BLEU)
 - Option: combinations (HTER)
 - Actually, no one uses word-to-word models alone as TMs
 - Method 2: measure quality of the alignments produced
 - Easy to measure
 - Hard to know what the gold alignments should be
 - Often does not correlate well with translation quality (like perplexity in LMs)

Alignment Error Rate

- Alignment Error Rate

□ = Sure

○ = Possible

■ = Predicted

$$AER(A, S, P) = \left(1 - \frac{|A \cap S| + |A \cap P|}{|A| + |S|}\right)$$

$$= \left(1 - \frac{3 + 3}{3 + 4}\right) = \frac{1}{7}$$

IBM Model 1: Allocation

IBM Model 1 (Brown 93)

- Alignments: a hidden vector called an *alignment* specifies which English source is responsible for each French target word.

$a = a_1 \dots a_j$

$$P(f, a|e) = \prod_j P(a_j = i) P(f_j|e_i)$$

$$= \prod_j \frac{1}{J+1} P(f_j|e_i)$$

$$P(f|e) = \sum_a P(f, a|e)$$

IBM Models 1/2

E: Thank you , I shall do so gladly .

Model Parameters

Emissions: $P(F_1 = \text{Gracias} | E_{A_1} = \text{Thank})$ Transitions: $P(A_2 = 3)$

Problems with Model 1

- There's a reason they designed models 2-5!
- Problems: alignments jump around, align everything to rare words
- Experimental setup:
 - Training data: 1.1M sentences of French-English text, Canadian Hansards
 - Evaluation metric: alignment error Rate (AER)
 - Evaluation data: 447 hand-aligned sentences

```

le
terme
ferroviaire
est
<<
chargement
sur
demande
>>
    
```

```

the
railroad
term
is
<<
demand
loading
>>
    
```

Intersected Model 1

- Post-intersection: standard practice to train models in each direction then intersect their predictions [Och and Ney, 03]
- Second model is basically a filter on the first
 - Precision jumps, recall drops
 - End up not guessing hard alignments

Model	P/R	AER
Model 1 E→F	82/58	30.6
Model 1 F→E	85/58	28.7
Model 1 AND	96/46	34.8

Joint Training?

- Overall:
 - Similar high precision to post-intersection
 - But recall is much higher
 - More confident about positing non-null alignments

Model	P/R	AER
Model 1 E→F	82/58	30.6
Model 1 F→E	85/58	28.7
Model 1 AND	96/46	34.8
Model 1 INT	93/69	19.5

IBM Model 2: Global Monotonicity

Monotonic Translation

Local Order Change

IBM Model 2

- Alignments tend to the diagonal (broadly at least)

$$P(f, a|e) = \prod_j P(a_j = i|j, I, J) P(f_j|e_i)$$

$$P(\text{dist} = i - j \frac{I}{J})$$

$$\frac{1}{Z} e^{-\alpha(i-j \frac{I}{J})}$$

- Other schemes for biasing alignments towards the diagonal:
 - Relative vs absolute alignment
 - Asymmetric distances
 - Learning a full multinomial over distances

EM for Models 1/2

- Model 1 Parameters:
 - Translation probabilities (1+2) $P(f_j|e_i)$
 - Distortion parameters (2 only) $P(a_j = i|j, I, J)$
- Start with $P(f_j|e_i)$ uniform, including $P(f_j|null)$
- For each sentence:
 - For each French position j
 - Calculate posterior over English positions

$$P(a_j = i|f, e) = \frac{P(a_j = i|j, I, J) P(f_j|e_i)}{\sum_{i'} P(a_j = i'|j, I, J) P(f_j|e_{i'})}$$

- (or just use best single alignment)
- Increment count of word f_i with word e_i by these amounts
- Also re-estimate distortion probabilities for model 2

- Iterate until convergence

Example

HMM Model: Local Monotonicity

Phrase Movement

On Tuesday Nov. 4, earthquakes rocked Japan once again

Des tremblements de terre ont à nouveau touché le Japon jeudi 4 novembre.

The HMM Model

E: Thank you , I shall do so gladly .

A: $\circ \rightarrow 1 \rightarrow 3 \rightarrow 7 \rightarrow 6 \rightarrow 8 \rightarrow 8 \rightarrow 8 \rightarrow 8 \rightarrow 9 \rightarrow \circ$

F: Gracias , lo haré de muy buen grado .

Model Parameters

Emissions: $P(F_1 = \text{Gracias} | E_{A_1} = \text{Thank})$ Transitions: $P(A_2 = 3 | A_1 = 1)$

The HMM Model

- Model 2 preferred global monotonicity
- We want local monotonicity:
 - Most jumps are small
- HMM model (Vogel 96)

$$P(f, a|e) = \prod_j P(a_j | a_{j-1}) P(f_j | e_i)$$

t	t(f e)
nationale	0.469
national	0.418
nationaux	0.054
nationales	0.029

- Re-estimate using the forward-backward algorithm
- Handling nulls requires some care
- What are we still missing?
