

# Statistical NLP Spring 2010

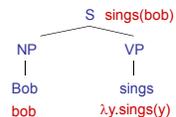

## Lecture 20: Compositional Semantics

Dan Klein – UC Berkeley

# Truth-Conditional Semantics

- Linguistic expressions:
  - "Bob sings"

- Logical translations:
  - sings(bob)
  - Could be  $p_{1218}(e_{397})$

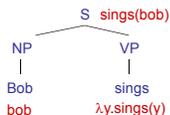

- Denotation:
  - $[[bob]]$  = some specific person (in some context)
  - $[[sings(bob)]]$  = ???

- Types on translations:
  - bob : e (for entity)
  - sings(bob) : t (for truth-value)

# Truth-Conditional Semantics

- Proper names:
  - Refer directly to some entity in the world
  - Bob : bob  $[[bob]]^w \rightarrow ???$

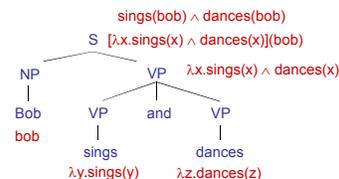

- Sentences:
  - Are either true or false (given how the world actually is)
  - Bob sings : sings(bob)

- So what about verbs (and verb phrases)?
  - sings must combine with bob to produce sings(bob)
  - The  $\lambda$ -calculus is a notation for functions whose arguments are not yet filled.
  - sings :  $\lambda x.sings(x)$
  - This is *predicate* – a function which takes an entity (type e) and produces a truth value (type t). We can write its type as  $e \rightarrow t$ .
  - Adjectives?

# Compositional Semantics

- So now we have meanings for the words
- How do we know how to combine words?
- Associate a combination rule with each grammar rule:
  - S :  $\beta(\alpha) \rightarrow NP : \alpha \quad VP : \beta$  (function application)
  - VP :  $\lambda x . \alpha(x) \wedge \beta(x) \rightarrow VP : \alpha$  and :  $\emptyset \quad VP : \beta$  (intersection)
- Example:

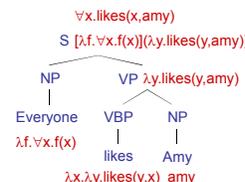

# Denotation

- What do we do with logical translations?
  - Translation language (logical form) has fewer ambiguities
  - Can check truth value against a database
    - Denotation ("evaluation") calculated using the database
  - More usefully: assert truth and modify a database
  - Questions: check whether a statement in a corpus entails the (question, answer) pair:
    - "Bob sings and dances"  $\rightarrow$  "Who sings?" + "Bob"
  - Chain together facts and use them for comprehension

# Other Cases

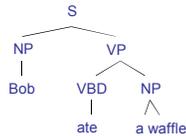

- Transitive verbs:
  - likes :  $\lambda x.\lambda y.likes(y,x)$
  - Two-place predicates of type  $e \rightarrow (e \rightarrow t)$ .
  - likes Amy :  $\lambda y.likes(y,Amy)$  is just like a one-place predicate.

- Quantifiers:
  - What does "Everyone" mean here?
  - Everyone :  $\lambda f.\forall x.f(x)$
  - Mostly works, but some problems
    - Have to change our NP/VP rule.
    - Won't work for "Amy likes everyone."
  - "Everyone likes someone."
  - This gets tricky quickly!

## Indefinites

- First try
  - "Bob ate a waffle" :  $\text{ate}(\text{bob}, \text{waffle})$
  - "Amy ate a waffle" :  $\text{ate}(\text{amy}, \text{waffle})$
- Can't be right!
  - $\exists x : \text{waffle}(x) \wedge \text{ate}(\text{bob}, x)$
  - What does the translation of "a" have to be?
  - What about "the"?
  - What about "every"?

## Grounding

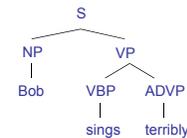

- Grounding
  - So why does the translation  $\text{likes} : \lambda x. \lambda y. \text{likes}(y, x)$  have anything to do with actual liking?
  - It doesn't (unless the denotation model says so)
  - Sometimes that's enough: wire up **bought** to the appropriate entry in a database
- Meaning postulates
  - Insist, e.g.  $\forall x, y. \text{likes}(y, x) \rightarrow \text{knows}(y, x)$
  - This gets into lexical semantics issues
- Statistical version?

## Tense and Events

- In general, you don't get far with verbs as predicates
- Better to have event variables  $e$ 
  - "Alice danced" :  $\text{danced}(\text{alice})$
  - $\exists e : \text{dance}(e) \wedge \text{agent}(e, \text{alice}) \wedge (\text{time}(e) < \text{now})$
- Event variables let you talk about non-trivial tense / aspect structures
  - "Alice had been dancing when Bob sneezed"
  - $\exists e, e' : \text{dance}(e) \wedge \text{agent}(e, \text{alice}) \wedge \text{sneeze}(e') \wedge \text{agent}(e', \text{bob}) \wedge (\text{start}(e) < \text{start}(e') \wedge \text{end}(e) = \text{end}(e')) \wedge (\text{time}(e') < \text{now})$

## Adverbs

- What about adverbs?
  - "Bob sings terribly"
  - $\text{terribly}(\text{sings}(\text{bob}))?$
  - $(\text{terribly}(\text{sings}))(\text{bob})?$
  - $\exists e \text{ present}(e) \wedge \text{type}(e, \text{singing}) \wedge \text{agent}(e, \text{bob}) \wedge \text{manner}(e, \text{terrible})?$
  - It's really not this simple..

## Propositional Attitudes

- "Bob thinks that I am a gummi bear"
  - $\text{thinks}(\text{bob}, \text{gummi}(\text{me}))?$
  - $\text{thinks}(\text{bob}, \text{"I am a gummi bear"})?$
  - $\text{thinks}(\text{bob}, \wedge \text{gummi}(\text{me}))?$
- Usual solution involves intensions ( $\wedge X$ ) which are, roughly, the set of possible worlds (or conditions) in which  $X$  is true
- Hard to deal with computationally
  - Modeling other agents models, etc
  - Can come up in simple dialog scenarios, e.g., if you want to talk about what your bill claims you bought vs. what you actually bought

## Trickier Stuff

- Non-Intersective Adjectives
  - $\text{green ball} : \lambda x. [\text{green}(x) \wedge \text{ball}(x)]$
  - $\text{fake diamond} : \lambda x. [\text{fake}(x) \wedge \text{diamond}(x)] ? \rightarrow \lambda x. [\text{fake}(\text{diamond}(x))]$
- Generalized Quantifiers
  - $\text{the} : \lambda f. [\text{unique-member}(f)]$
  - $\text{all} : \lambda f. \lambda g. [\forall x. f(x) \rightarrow g(x)]$
  - $\text{most}?$
  - Could do with more general second order predicates, too (why worse?)
    - $\text{the}(\text{cat}, \text{meows}), \text{all}(\text{cat}, \text{meows})$
- Generics
  - "Cats like naps"
  - "The players scored a goal"
- Pronouns (and bound anaphora)
  - "If you have a dime, put it in the meter."
- ... the list goes on and on!

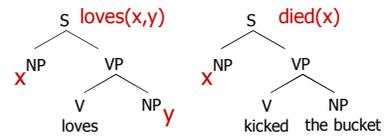

## Multiple Quantifiers

- Quantifier scope
  - Groucho Marx celebrates quantifier order ambiguity:
    - "In this country a woman gives birth every 15 min.
    - Our job is to find that woman and stop her."
- Deciding between readings
  - "Bob bought a pumpkin every Halloween"
  - "Bob put a warning in every window"
  - Multiple ways to work this out
    - Make it syntactic (movement)
    - Make it lexical (type-shifting)

## Implementation, TAG, Idioms

- Add a "sem" feature to each context-free rule
  - $S \rightarrow NP \text{ loves } NP$
  - $S[\text{sem}=\text{loves}(x,y)] \rightarrow NP[\text{sem}=x] \text{ loves } NP[\text{sem}=y]$
  - Meaning of S depends on meaning of NPs

- TAG version:

- Template filling:  $S[\text{sem}=\text{showflights}(x,y)] \rightarrow$   
I want a flight from NP[sem=x] to NP[sem=y]

## Modeling Uncertainty

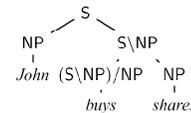

- Gaping hole warning!
- Big difference between statistical disambiguation and statistical reasoning.
  - The scout saw the enemy soldiers with night goggles.*
    - With probabilistic parsers, can say things like "72% belief that the PP attaches to the NP."
    - That means that *probably* the enemy has night vision goggles.
    - However, you can't throw a logical assertion into a theorem prover with 72% confidence.
    - Not clear humans really extract and process logical statements symbolically anyway.
    - Use this to decide the expected utility of calling reinforcements?
- In short, we need probabilistic reasoning, not just probabilistic disambiguation followed by symbolic reasoning!

## CCG Parsing

- Combinatory  
Categorial  
Grammar

- Fully (mono-)lexicalized grammar
- Categories encode argument sequences
- Very closely related to the lambda calculus
- Can have spurious ambiguities (why?)

$John \vdash NP : john'$   
 $shares \vdash NP : shares'$   
 $buys \vdash (S \setminus NP) / NP : \lambda x. \lambda y. buys'xy$   
 $sleeps \vdash S \setminus NP : \lambda x. sleeps'x$   
 $well \vdash (S \setminus NP) \setminus (S \setminus NP) : \lambda f. \lambda x. well''(f(x))$

## Syntax-Based MT

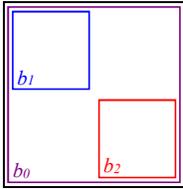

- synchronous context-free grammars (SCFGs)
  - context-free grammar in two dimensions
  - generating pairs of strings/trees simultaneously
  - co-indexed nonterminal further rewritten as a unit

$VP \rightarrow PP^{(1)} VP^{(2)}, VP^{(2)} PP^{(1)}$   
 $VP \rightarrow \text{juxing le huitan, held a meeting}$   
 $PP \rightarrow \text{yu Shalong, with Sharon}$

## Discriminative Block ITG

Features

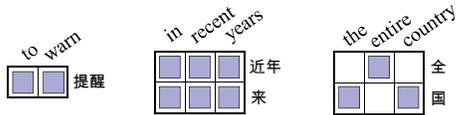

$$\phi(b_0, s, s')$$

$$\phi(b_1, s, s')$$

$$\phi(b_2, s, s')$$

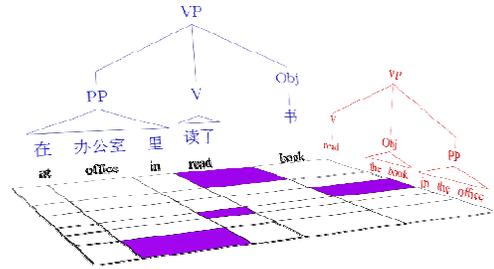

$$\phi(A) = \sum_{b \in A} \phi(b, s, s')$$

$$P(A) \propto \exp(\theta, \phi(A))$$

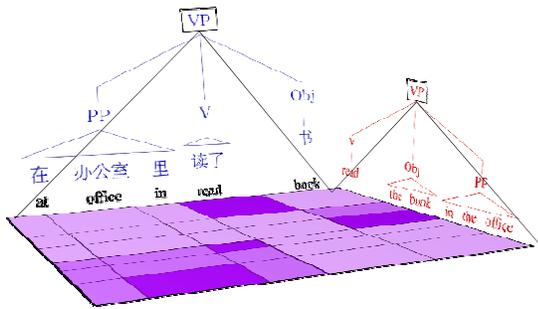

[Haghighi, Blitzer, Denero, and Klein, ACL 09]

## Syntactic Correspondence

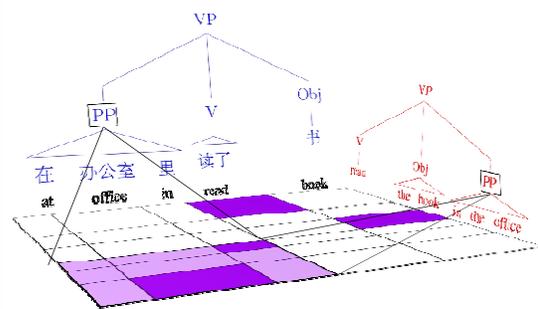

Build a model  $p_{\theta}(\Delta, \triangle, \square, \text{中文}, \text{EN})$

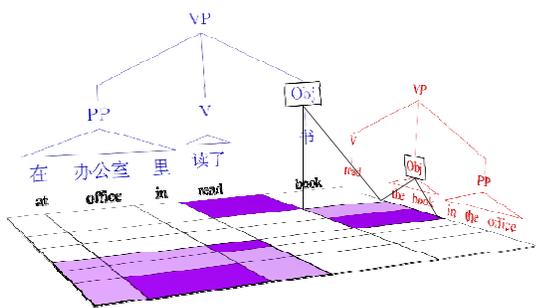

## Synchronous Grammars?

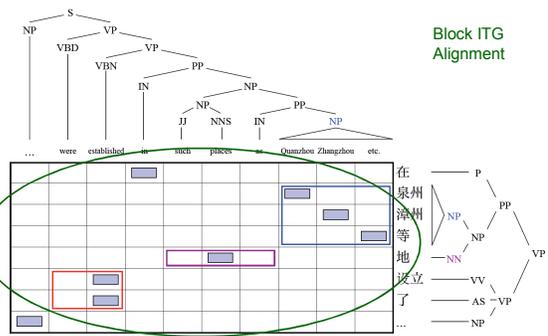

## Synchronous Grammars?

## Synchronous Grammars?

## Adding Syntax: Weak Synchronization

### Adding Syntax: Weak Synchronization

Separate PCFGs

### Adding Syntax: Weak Synchronization

Get points for synchronization; not required

### Weakly Synchronous Features

Parsing	Alignment
$\phi_{\mathcal{P}}(IP, s)$	$\phi_{\mathcal{A}}(b_0, s, s')$
$\phi_{\mathcal{P}}(NP, s)$	$\phi_{\mathcal{A}}(b_1, s, s')$
$\phi_{\mathcal{P}}(VP, s)$	$\phi_{\mathcal{A}}(b_2, s, s')$
Agreement	
$\phi_{\mathcal{E}}(S, s')$	$\phi_{\mathcal{D}}(IP, b_0)$
$\phi_{\mathcal{E}}(NP, s')$	$\phi_{\mathcal{D}}(b_0, S)$
$\phi_{\mathcal{E}}(AP, s')$	$\phi_{\mathcal{D}}(b_1, NP)$
$\phi_{\mathcal{E}}(VP, s')$	$\phi_{\mathcal{D}}(IP, b_0, S)$

### Weakly Synchronous Model

$p_{\theta}(\triangle, \blacktriangle, \text{办公室} | \text{EN, 中文})$

Feature Type 1: Word Alignment  
 $\phi(\text{办公室}, \text{EN}, \text{中文})$

Feature Type 2: Monolingual Parser  
 $\phi(\blacktriangle, \text{EN})$

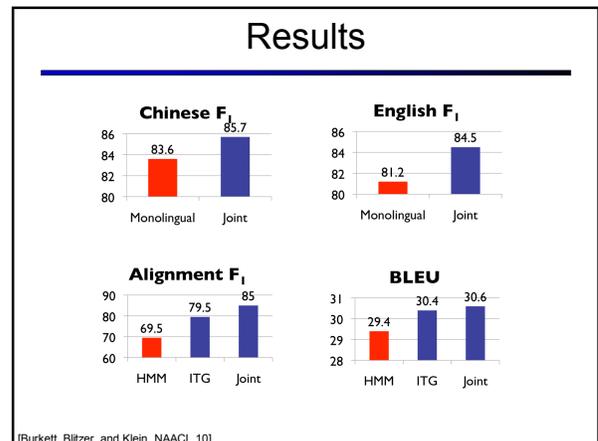

Feature Type 3: Agreement  
 $\phi(\triangle, \blacktriangle, \text{办公室})$

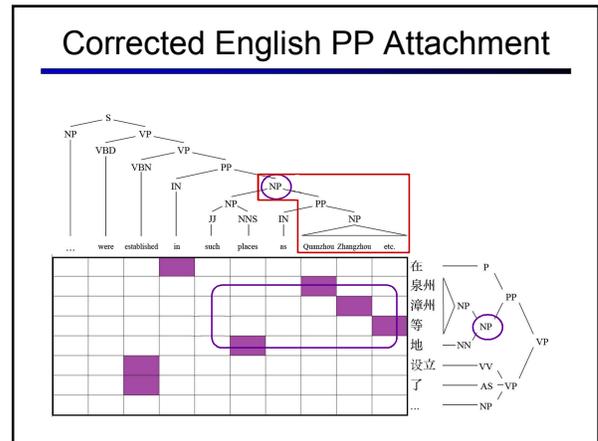

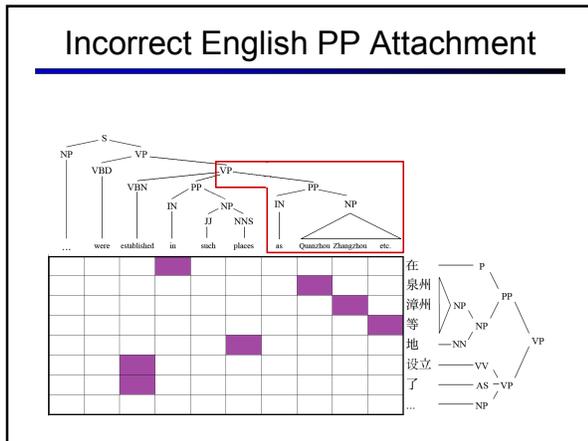

### Inference: Structured Mean Field

- Problem: Summing over weakly aligned hypotheses is intractable
- Factored approximation:  $p_{\theta}(\triangle, \blacktriangle, \text{办公室} | \text{EN, 中文}) \approx q(\triangle)q(\blacktriangle)q(\text{办公室})$
- Set  $q$  to minimize  $KL(q(\triangle)q(\blacktriangle)q(\text{办公室}), p_{\theta}(\triangle, \blacktriangle, \text{办公室} | \text{EN, 中文}))$

**Algorithm**

- Initialize:  $q(\triangle)q(\blacktriangle)q(\text{办公室})$
- Iterate:
  - $q(\triangle) \propto \exp\{\langle \theta, \phi(\triangle, E_q(\blacktriangle), E_q(\text{办公室})) \rangle\}$
  - $q(\blacktriangle) \propto \exp\{\langle \theta, \phi(E_q(\triangle), \blacktriangle, E_q(\text{办公室})) \rangle\}$
  - $q(\text{办公室}) \propto \exp\{\langle \theta, \phi(E_q(\triangle), E_q(\blacktriangle), \text{办公室}) \rangle\}$

### Improved Translations

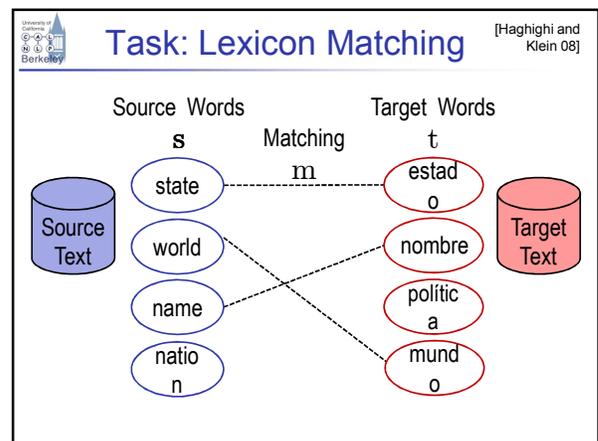

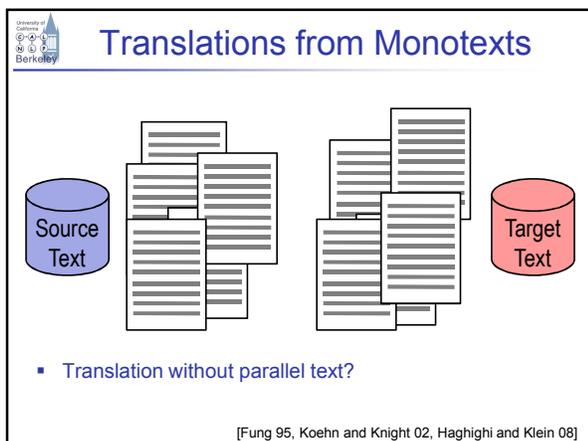

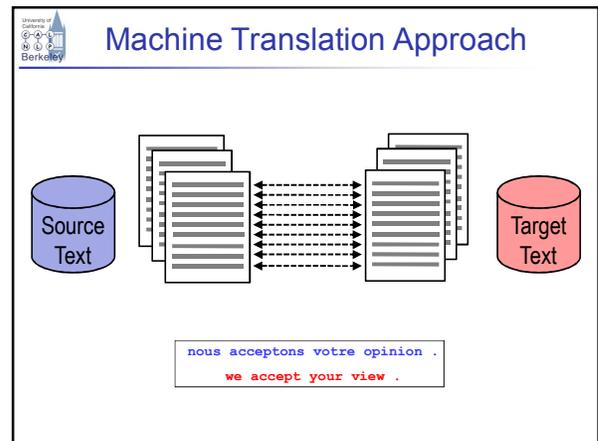

目前导致飞机相撞的原因尚不清楚，当地民航部门将对此展开调查

Cur- cause plane crash DE reason yet not clear, local civil bureau will toward open investi-  
rently acro- nautics gations

**Reference**  
At this point the cause of the plane collision is still unclear. The local caa will launch an investigation into this .

**Baseline (GIZA++)**  
The cause of planes is still not clear yet, local civil aviation department will investigate this .

**Bilingual Adaptation Model**  
The cause of plane collision remained unclear, local civil aviation departments will launch an investigation .

### Generative Model (CCA)

Canonical Space  $\mathbb{R}^d$

$z \sim \mathcal{N}(0, I_d)$

$W_s z + \text{noise}$

Source Space  $\mathbb{R}^{d_s}$

state

$W_t z + \text{noise}$

Target Space  $\mathbb{R}^{d_t}$

estado

### Generative Model (Matching)

Source Words **s**

Target Words **t**

Matching **m**

state --- estado

world --- nombre

name --- politica

nation --- mundo

### Inference: Hard EM

**E-Step:** Find best matching

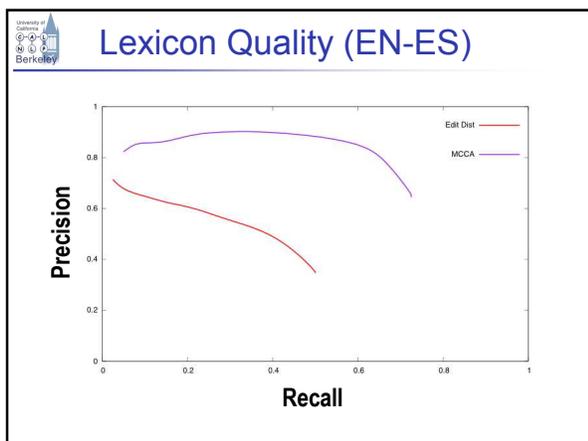

$$w_{ij} = \log p(s_i, t_j | \mathbf{m}; W_s, W_t) - \log \text{NULL}_S(s_i) - \log \text{NULL}_T(t_j)$$

**M-Step:** Solve a CCA problem

$$\max_{(W_s, W_t)} \left[ \sum_{(i,j) \in \mathbf{m}} \log p(s_i, t_j | \mathbf{m}; W_s, W_t) \right]$$

### Experimental Setup

- Data: 2K most frequent nouns, texts from Wikipedia
- Seed: 100 translation pairs
- Evaluation: Precision and Recall against lexicon obtained from Wiktionary
  - Report  $p_{0.33}$ , precision at recall 0.33
